

Spatial distribution of composition-defined niches

- Tumour and epidermis (n = 226)
- Epithelial-stromal interface (n = 155)
- Fibroblast-rich stroma (n = 114)
- Inflammatory stroma (n = 109)

Mean cell-type composition per niche

Deconomix does not constrain the per-spot estimates to sum to one. Each spot was rescaled to a total of 1 before clustering, so the values shown are relative proportions and carry no information about the amount of material in a spot.
